**Specification**

Volumetric solution in accordance to the chapter reagents of the Pharmacopoeia (USP).  
Amount-of-substance concentration .0.1000 mol/l  
The concentration of this volumetric solution was determined with volumetric standard benzoic acid

(Merck article number 1.02401). The determined titer at 20°C was 1.000 with an expanded measurement uncertainty of  $\pm 0.004$  ( $k=2$  coverage factor for 95% coverage probability). The certified value is traceable to primary standard NIST SRM 350b (NIST: National Institute of Standards and Technology, USA) by means of volumetric standard benzoic acid, measured in the accredited calibration laboratory of Merck KGaA in accordance to DIN EN ISO/IEC 17025.

## Specification

Description ..... clear, colourless liquid

Identity ..... conforms

Assay (iodometric) ..... ≥ 99 % (m)

Solubility (USP) ..... conforms

Sensitivity (USP) ..... conforms

Fe (Iron) ..... ≤ 0,00005 % (m)

Organic bound chlorine ..... ≤ 0,01 % (m)

Sulfated ash ..... ≤ 0,05 % (m)

The statement of the assay applies to the test date. A gradual substance-specific content reduction, especially at higher temperatures, must be expected.

 Highly purified special reagent for high sensitive microsequencing of proteins. Anhydrous acid to cleave the PTC-residue from the PTC-protein derivative under release of the terminal amino acid as a thiazoline that can be separated from the residual peptide and converted to the more stable phenylthiohydantoin.

108450 Trifluoromethanesulfonic acid in anhydrous acetic acid c (CF<sub>3</sub>SO<sub>3</sub>H) = 0.1 mol/l Titripur®**Specification**

Amount-of-substance concentration 0.1000 mol/l  
 The concentration of this volumetric solution was determined with volumetric standard Tris(hydroxymethyl)aminomethane (Merck article number 1.02408). The determined titer at 20 °C was 1.000 with an expanded measurement

uncertainty of +/-0.004 (k=2 coverage factor for 95% coverage probability). The certified value is traceable to primary standard NIST SRM 723e (NIST: National Institute of Standards and Technology, USA) by means of volumetric standard Tris(hydroxymethyl)aminomethane, measured in the accredited calibration laboratory of Merck KGaA

in accordance to DIN EN ISO/IEC 17025.

 Catalysed reaction: Urea + H<sub>2</sub>O → 2NH<sub>3</sub> + CO<sub>2</sub>.  
 This completely soluble quality is especially

suitable for the determination of urea via ammonia by the GIDH method, but it is also suitable for the determination of urea by the Berthelot reaction, e.g. in research or food analysis.

Amount-of-substance concentration . 0.1000 mol/l

The concentration of this volumetric solution was determined with sodium thiosulfate standard solution (Merck article number 1.09147) standardized against volumetric standard potassium iodate (Merck article number 1.02404). The determined titer at 20°C was 1.000 with an expanded measurement uncertainty of +/-0.004 (k=2 coverage factor for 95% coverage probability).

The certified value is traceable to primary standard NIST SRM 136f (NIST: National Institute of Standards and Technology, USA) by means of volumetric standard potassium iodate, measured in the accredited calibration laboratory of Merck KGaA in accordance to DIN EN ISO/EC 17025.

**Specification**  
 Amount-of-substance concentration . 0.1000 mol/l

The concentration of this volumetric solution was determined with titriplex-III standard solution (Merck article number 1.08431) standardized against volumetric standard zinc (Merck article number 1.02409). The determined titer at 20 °C was 1.000 with an expanded measurement uncertainty of ± 0.003 (k=2 coverage factor for 95% coverage probability). The certified value is traceable to primary standard NIST SRM 682 (NIST: National Institute of Standards and

Technology, USA) by means of volumetric standard zinc, measured in the accredited calibration laboratory of Merck KGaA in accordance to DIN EN ISO/EC 17025.

## Quality is what the customer defines as quality

Reagents and chemicals supplied by Merck have, for some 150 years, been synonymous with quality throughout the world. State-of-the-art analytical laboratories staffed by highly qualified personnel guarantee the specifications according to international standards and – taking into account relevant legal requirements – our own internal testing methods. On the 48 production sites of the chemical operations more than 60,000 products and processes are in our portfolio. More than 1,000 people worldwide and 450 people at Merck headquarters and main production site in Darmstadt in the Chemicals business sector are engaged in analytical quality control work in Quality Assurance (cGMP, ISO). The basis of the high level of Merck's quality is the experience and skills of the personnel, who monitor the excellent quality with state of the art methods and IT-systems.

The complex instrumental and wet chemical testing procedures involved are constantly updated in line with technical and method developments. "Quality" is thus a Merck tradition. This is demonstrated by the declaration that the founder of the company, Heinrich Emanuel Merck, gave to a customer back in 1851: "I fully guarantee the purity of my preparations and take the responsibility for any disadvantage you may have through using a contaminated product ..." Till today with the Quality Mission Statement of Merck Millipore:

"We deliver Quality – always ..."

At Merck today, the term quality means far more than just traditional product quality; it also includes the essential elements of customer service. This means, in particular, fulfilling the needs and expectations of customers. Hence, even though a reagent user may primarily expect product purity and batch-to-batch reproducibility of the reagent supplied, a number of other service elements are also important, e.g. speed of delivery, application-oriented packaging, competent advice, accessibility, environmental compatibility, reliability of results and much more. These are the qualities that make for permanent business relationships. Customer satisfaction is Merck's prime quality standard.

Today, the integrated quality-management systems **DIN EN ISO 9001**, **17025** and **13485** and also cGMP standards form the basis of our quality philosophy. The adherence to the high level of our quality standards is repeatedly confirmed by successful audits conducted by internal audits, regulatory bodies, official agencies and our customers. This gives us the impetus to bring our efforts to perfection.

We fulfill customer-specific requirements such as additional parameters, customized certificates of analysis, and special packaging units. Individual consultation and just-in-time delivery of order consignments from our broad product range are a matter of course.

### Quality grades

You can be certain of the proper application of the products on the basis of our batch-to-batch consistency, the batch-specific certificates of analysis measured against the product specifications, and our statement of the minimum shelf-life together with the appropriate storage details for the unopened product package.

Our broad spectrum of quality grades and products provides you with a scope of use for the most varied range of applications. We invite you to make use of our special service support if you have any further inquiries. The following listing gives you an overview of the various quality and application terms and abbreviations.

Products designated "pure" or "extra pure" are especially suitable for use in industrial production. The range of fine and industrial chemicals with this designation may be used in various industrial sectors such as pharmaceuticals, chemicals, cosmetics, foodstuffs, lacquers, printing dyes and optical and electronic components.

Reagents and constituents for laboratory-scale chemical synthesis as well as for a wide variety of industrial-technical applications are additionally designated **EMPLURA**® and "for synthesis". This quality standard meets the requirements of preparative chemistry. The users of non-GMP materials for pharmaceutical synthesis need

more and more additional information about such materials. With our brand "for pharma synthesis, non-GMP" an additional Qualification Dossier is available.

**EMPARTA**® solvents are suitable for classical analytical lab applications. The quality of these products conforms to the specification of the ACS (American Chemical Society). With the quality **EMSURE**® and **GR for analysis** and we offer a comprehensive range of reagents for a multitude of classical laboratory applications. An unrivalled range of comprehensive and extensive specifications with up to 60 parameters combined with the declaration of international standards (e.g. ISO, ACS, Reag. Ph Eur) gives proven safety to our customers and enables the use in an extraordinarily wide range of applications. In addition, an unparalleled range of packaging completes our offer.

**ISO:** Specifications according to the standards of the "International Organization for Standardization".

**ACS:** Specifications conform to those given in the "Book of Reagents" and current amendments of the American Chemical Society.

**Reag. USP:** Reagent specifications of the USP; correspond in almost all cases to the ACS and are thus listed only in exceptional cases.

**Reag. Ph Eur:** Specifications conform to the requirements for reagents specified by the European Pharmacopoeia.

**LiChrosolv**® (for analytical HPLC and new also for LC/MS applications) and **Prepsolv**® (for preparative HPLC) are tailor-made solvent qualities for liquid chromatography. They are characterized by highest batch-to-batch consistency, high UV transmittance, low particle count, low acidity and alkalinity combined with low residues on evaporation.

**SeccoSolv**® Dried solvents are suitable for the analysis or synthesis of water sensitive substances. Also for DNA synthesis we are able to offer specially dried reagents to optimize the amounts in oligo nucleotides.

The solvent qualities **SupraSolv**® and **UniSolv**® cover all laboratory applications for gas chromatography with the maximum of security and reliability. **SupraSolv**® solvents are specially developed for the high sensitive pesticide residue analyses of e.g. environmental and food samples, detected by GC-ECD. For determinations of highly volatile chlorinated hydrocarbons present in ppb trace amounts only and for highly demanding GC-MS and GC-FID applications, the **UniSolv**® solvents are particularly suitable.

The **Uvasol**® range has been specially designed for spectroscopy (UV, IR, fluorescence) and for other applications requiring solvents of the highest spectral purity. The specifications include minimum transmittances at certain wavelengths within the UV-range, fluorescence and other application orientated suitability parameters.

**Deuterated solvents** are required for the most important method in the structural analysis of organic molecules – Nuclear Magnetic Resonance (NMR) Spectroscopy. Merck Millipore's deuterated solvents are characterized by extremely low residual water, excellent chemical purity, and the highest isotopic enrichment available.

**Suprapur**® reagents, primarily acids, bases and salts, are products of highest purity and hence suitable for trace analysis. Due to the high purity of the reagents, in many cases in the ppt-range, the given data in the certificate of analysis is put on a level of the detection limit of the used analytical test method.

Increasingly stringent requirements have led to the development of the **Ultrapur**® grade for the most important acids as well as hydrogen peroxide and water which certifies contamination levels in the ppt-range – with effective values in the ppq-range.

Products designated as "for biochemistry" are especially suitable for the use in pharmaceutical research and development, in biochemical analysis and in biotechnology. The range of reagents available includes amino acids, biological buffers, carbohydrates, enzymes, coenzymes and various reagents.

These high purity reagents are specified according to all critical parameters relevant for biochemical applications, such as heavy metals, inhibitors and foreign proteins. Merck Millipore enforces a high-level quality manage-

ment system based on the latest regulations such as **ISO 11133**, and including all relevant certificates. We also regularly pass audits conducted by international companies and government authorities. When it comes to designing products "for microbiology", for the majority of products Merck Millipore completes every step of the process in-house. Our products are held in high esteem across the globe for their unparalleled quality, innovation, and safety. The secret of our success is simple: quality control and quality assurance are central to everything we do.

Products for use as **in vitro diagnostic** medical devices Most products of microscopy; some products of microbiology and one pH-stick comply with European "Directive 98/79/EC on in vitro diagnostic medical devices" and bear the CE marking. They are classified as devices "other than those covered by Annex II". Products without **CE marking** on the label are not intended for use as medical devices for in vitro diagnostic testing of human specimens. They are for research purposes only, for investigating in vitro samples without any medical objective. For further information about quality grades, trade names, etc. please see "Trademarks".

### Quality documentation

The **Certificate of Analysis** lists the test parameters and analytical values of the chemical substance involved. If absolute values are available, these are given; however, if the degree of contamination is lower than the detection limit of the method used, absolute values cannot be given. A Certificate of Analysis can be downloaded from the WEB ([www.merckmillipore.com](http://www.merckmillipore.com)); frequently, however, e.g. in the case of reference materials and standards, it is included in the package.

In addition, in the case of numerous compounds, the date of analysis and the shelf life are indicated on the package. The shelf life data – which are also indicated on the label – are based on current knowledge; they are valid only if the product is stored properly and the package remains unopened. As soon as the package is opened, the shelf life responsibility is transferred to the user.

### Accreditation

The basis of our accreditation is the adherence to European Standard **DIN EN ISO/IEC 17025**. The accreditation attests the competence of the laboratory to produce technically valid data and results. All instrumentation used is regularly checked by officially authorized calibration laboratories. In addition, all relevant parameters used in measurement, e.g. as amount of substance, mass and temperature, have to correspond to national and international standards which are related to the international system of units (SI units). The accreditation is compliant with the company-wide certification of the quality management system according to **DIN EN ISO 9001**.

Since 1994, Merck Millipore has run its own, **accredited calibration laboratory for pH and conductivity measurement**. High precision pH measurement is performed by the use of standard hydrogen electrodes. The laboratory registered under **DKD-K-14301** has been accredited and regularly audited by DKD (Deutscher Kalibrierdienst/German Accreditation Body). The quality of all Merck Millipore buffer substances, buffer solutions and conductivity solutions is controlled by our accredited laboratory.

Since 2004, the laboratory at Merck Millipore for the quality control of single element standards has been accredited by DKD as calibration laboratory registered under **DKD-K-14302**. The precision elemental analysis is performed by ICP-OES. Reference materials for calibrating analytical instruments in elemental analysis are the fundamental basis in all analytical laboratories worldwide. ...

Merck Millipore certifies its **CertiPUR**® reference materials for the measurement of pH, conductivity and elemental analysis in its own, accredited calibration laboratories. All Certi-PUR® products are traceable to primary standard reference materials certified by PTB (Physikalisch-Technische Bundesanstalt/Federal Physical-Technical Institute, Braunschweig, Germany) or NIST (National Institute of Standards and Technology, Gaithersburg, Maryland, USA). Both of the traceability procedures are documented in the Certificate of Analysis.

## In general

The products are tested and specified for the stated areas of application as per the declaration enclosed for each batch. The customer is responsible for testing the suitability of the product in question for any applications that are not among those listed (cf. also the General terms of delivery).

Further information on quality issues at Merck Millipore can be found at [www.merckmillipore.com](http://www.merckmillipore.com).

# H/P statements

## Hazard and precautionary statements, hazard pictograms

The properties of all Merck products are evaluated in detail. Items classified as hazardous are labeled in accordance with EU regulations.

These demand labeling with hazard pictograms, a signal word, and the inclusion of hazard and precautionary statements.

It must be noted, that at the time of going to print, the classification of products in the catalog might differ from the information on labels and safety data sheets, because we classify our products according to the latest empirical findings and legal regulations. Where a label apparently disagrees with the catalog entry, the label shall invariably take precedence. For small packages with volumes not exceeding 125 ml we make use of the exemptions as laid down in Regulation (EC) No 1272/2008, Annex I, 1.5.2.1.

While this catalog always states the complete labeling information, for reasons of space the labeling of small packages may differ. Both the full and – where applicable – the reduced labeling information can be referred to in the Safety Data Sheet.

Example n-hexane:

Labeling on the 1 l bottle: [H225](#), [H304](#), [H361f](#), [H373](#), [H315](#), [H336](#), [H411](#)

Reduced labeling on the 5 ml bottle: [H304](#), [H361f](#)

Both packages will bear four pictograms and the signal word “danger” as well as appropriate precautionary statements. The full classification and labeling information can always be referred to in the Safety Data Sheet.

# Packaging

## Packaging

The following package types with ordering information are available:

### Alu bottle = Aluminum bottle

Aluminum bottles are currently used for some solvents as non-breakable containers. Advantage: 100% diffusion-proof.

### Alu can = Aluminum can

Aluminum cans are used for some solids as non-breakable and diffusion-proof containers.

### Aluminium tube

These are used e.g. for test strips and are sealed off with plastic stoppers. In the case of hygroscopic materials, the stopper can be provided with a drying agent.

### Barrel PE/met = Plastic receptacle in steel barrel

These barrels comprise an external lacquered metal mantle and an internal polyethylene lining which is extremely resistant to aggressive acids. As the outer mantle can be grounded, these barrels can be used for transporting, storing and filling solvents.

### Barrel PE/PE = Plastic receptacle in plastic barrel

These barrels have an external very stable polyethylene mantle and an internal polyethylene liner made of particularly pure polyethylene without additives as used e.g. in the semiconductor industry. Advantages: No risk of contamination, high degree of mechanical stability.

### Barrel stainl. st. = Barrel stainless steel

Stainless steel barrels in volumes of 10 l, 30 l and 185 l are used for packaging high-purity organic solvents. Special withdrawal systems, including permanent systems with their own piping, facilitate withdrawal of solvent. Each stainless steel barrel has its own identification serial number and can thus be traced at any time. All such recyclable barrels remain the property of Merck Millipore and are simply made available on a temporary basis (6 – 8 weeks) to the user. Customers are kept informed on outstanding barrels by Merck Millipore. Merck Millipore retains the right to charge, at purchasing prices, for damaged or lost vessels.

### Big Bag = Flexible IBC

Big Bags are large containers (> 500 l) for solids. They have an external layer of plastic material to provide stability when filled. The inner container is a plastic bag designed to provide product protection. Advantages: low packaging material weight, can be folded together.

### Carboy = Glass carboy

Carboys have a volume of 22.5 l and are used for transporting products that tend to react with plastic or metal. The outer packaging used is polyethylene or polystyrene.

### Container = Tank container

Large volumes of product are supplied in tank containers. These are mostly product-dedicated and customized to particular applications. The containers are recyclable.

### Double PE Sack (DPES)

The double PE sack (DPES) is a packaging system consisting of an outer and an inner sack to meet the growing demand for packaging that can be used under clean-room conditions. In an area next to the production room the fully labelled outer sack is removed from the inner sack by tearing along the perforated seam. The clean inner sack, labelled with the most important product data, is then conveyed into the production room where the product is used. The sack-in-sack principle of the Double PE Sack ensures that no packaging-borne contaminants can enter the production room. The Double PE sacks are dispatched in corrugated cardboard cartons or loaded onto pallets.

### Drum, fiber = Fiberboard drum

These are made of several layers of heavy-duty fiberboard. Base and lid may be made of other materials, e.g. wood or metal. Advantages: Low weight, high degree of stability.

### Drum stainl. st. = Drum stainless steel

Stainless steel drums in volumes of 10 l, 25 l and 190 l are used for packaging "GR", "for synthesis" and "extra pure" organic solvents. Advantages: Recyclable vessels with no time limit for use, optimal emptying via special withdrawal systems. Containers should be returned to Merck Millipore as soon as possible once empty.

### EPS box

These are made-to-measure boxes made of expanded polystyrene (EPS) for glass bottles. Advantages: They provide protection from external impact, limit the risk of breakage and protect the contents from short-term fluctuations in temperature.

### Fiber carton

These are used for solids and are made of 1 or 2 layers of heavy-duty fiberboard. Waterproof glue provides protection against the effects of moisture. The cartons are stable and can be stacked and are hence optimal for the Merck Millipore CP-5 range of products (114 x 76 cm). They are optimal for space utilization and transport. They have been officially tested and are UN-approved. Polyethylene sacks provide product protection.

### Fiber case

These are used for test sets, test kits and HPLC columns.

### Gas cylinder

Gases are stored in pressurized lecture bottles and can be connected directly at their place of use.

### Glass ampoul

Glass as an inert material is suitable for use with all types of contents, including aggressive products. Glass ampoules are used for different reagents and closed with KT15 screw caps. Advantages: optimal tightness, pressure stability.

### Glass bottle

Glass as an inert material is suitable for use with all types of contents, including aggressive products. Glass bottles are colored brown and provide protection against light. Glass is also impervious to air and water vapor and hence guarantees a high degree of stability and corresponding long storage times. Glass bottles for use with liquids are fitted with S 28 or S 40 caps; glass bottles for solids have an S 40, S 60 or S 85 cap, depending on the volume. Advantages: Optimal tightness, pressure stability. Glass bottles are transported in made-to-measure inserts (polystyrene or corrugated cardboard) in UN-approved cartons.

### Glass btl. Duran = Glass bottle Duran (borosilicate glass)

These high-quality colorless bottles of hydrolytic grade 1 are used for the transport and storage of high-purity chemicals (e.g. Suprapur grade). Advantages: No contamination and hence maintenance of the high purity of the contents.

### Glass btl. pl. coat. = Glass bottle with plastic jacket

These bottles provide additional safety when used with hazardous chemicals. If they fall off a laboratory bench, the form remains intact and the contents may not even spill. More time is thus available for enacting safety procedures.

### Metal can

Oxidizing solids and some dyes are first packed in polyethylene bags and then enclosed in metal cans for additional protection.

### Plastic ampoule

Titrisol®, concentrates for making up buffer solutions, standard solutions and volumetric solutions are filled in polyethylene ampoules. Advantage: Can be opened without the help of tools.

### Plastic bag

Many solids, e.g. those used as food additives, are packaged in polyethylene bags in smaller volumes. They are then dispatched in folding cartons.

### Plastic barrel

These are made of high-density polyethylene (HDPE) and have a volume of 200 l. They are universally used for packaging most acids, alkaline and aqueous solutions and have a 2" opening. Numerous withdrawal systems can be connected. Advantages: Easy withdrawal, optimal emptying.

### Plastic bottle

Most plastic bottles are made of high-density polyethylene (HDPE). Current bottles are colored against the effects of UV radiation (white in the case of solids; black for liquids). They are available in volumes of 2.5 l and 5 l and are easy to use due to their integrated grip. From a volume of 250 ml, they have an S 40 cap. Bottles for solids have a large opening to facilitate withdrawal and have caps up to S 85.

### Plastic box

These are used for test kits. They are robust and are protected from splashes. They contain all components and additional tools of a test kit.

### Plastic bucket

These are used to safely carrying glass bottles with chemicals. In case of any accident the chemical spills into the bucket.

### Plastic can

These are made of HDPE and have volumes of 5 l, 10 l, 25 l and 60 l. They are used for acids, alkaline and aqueous solutions. Blue containers are used for contents sensitive

to light. All containers have a standard KS 60 x 6 external thread. Connectors and withdrawal aids are available.

### Plastic case

These are used for carrying kits, e.g. test kits. They are robust, have a grip and are protected from splashes. They are mobile and can be used in inclement weather. The hinged lid can be used as a working area.

### Plastic drum

Solids are packed in polyethylene sacks and then inserted in stable plastic drums. Advantages: Highly stable, large volumes possible.

### Plastic IBC = Plastic IBC (Tank pallet)

These IBCs (Intermediate Bulk Containers) are 400 – 1,000 l plastic containers. Made of highly resistant high-density polyethylene (HDPE), they are suitable for acids and alkaline solutions. Advantages: Reduced volume of packaging materials, optimal utilization of available volume, easy connection, recyclable/returnable (depending on contents).

### Plastic tube

These are used e.g. for test strips and are sealed off with plastic stoppers. In the case of hygroscopic materials, the stopper can be provided with a drying agent.

### Sachets

Sachets are made of aluminum-laminated plastic foil for pre-portioned quantities of liquids, e.g. buffer solutions. The material structure and the materials employed make these sachets absolutely tight and the contained solution stable.

### Safebreak btl. = Safebreak bottle

Safebreak bottles are glass bottles with a polyethylene (PE) coating. In case of a breakage the liquid and glass splinters are reliably retained within the polyethylene coating. Empty and acid-free Safebreak bottles can be recycled together with conventional glass bottles.

### Septum ampoule

These are ampoules made of glass with an integrated septum for removing samples with a syringe in a contamination free way. Subsequent to sampling, the septum closes itself off and becomes airtight again.

### Steel barrel

Non-returnable steel barrels in volumes of 25 l and 190 l. On the inside, they are coated with a chemically-resistant lacquer to prevent corrosion. Primarily used for organic solvents.

### Steel drum

Oxidizing solids are packed in polyethylene sacks and then placed in robust steel drums. The external surface is coated with a special substance to prevent corrosion. Advantages: Highly stable, large volumes possible.

### Steel IBC = Container steel IBC

IBC (Intermediate Bulk Container) containers are made of stainless steel and are used for tank pallets of 400 – 1,500 l for large users. Advantages: Packaging material reduced, volume utilization, recyclable.

### Titripac PE/Alu = Titripac Plastic/Aluminum

Volumetric solutions in larger volumes for laboratory purposes are supplied in corrugated cardboard cartons with a plastic bag liner. The flexible liner collapses when product is removed, hence preventing laboratory air from entering and altering the titer. In this way, the titer remains constant over a long period of time. Additional advantage: Integrated tap makes for ease of use.

### Tube

Tubes are ideal for pastes as the reagent can be portioned. After use, the tube can be closed off.

## StoreCard – Mixed storage of chemicals

Hazardous materials must be stored in such a way that:

- risks involved in storing incompatible materials together are minimized.
- dangerous, violent reactions, such as the generation of flammable gases or very toxic gases are prevented.
- in the event of fire, toxic smoke is avoided.

For safety reasons, all products to be stored must be classified in the storage class relevant to their specific hazard characteristics. A chemical can only be classified in one storage class. Chemicals having more than one hazardous property are assigned to a class based on a ranking system for the hazard involved. This guarantees that chemicals with the same or similar hazardous properties can be treated similarly with regard to the necessary safety measures, in particular fire and explosion protection. All Merck Millipore reagents and chemicals are assigned to the storage class stated in their respective Material Safety Data Sheets (MSDS) and online in <http://www.merckmillipore.com>.

### Storage classes

- 1 Explosive substances
- 2 A Gases
- 2 B Aerosols
- 3 Flammable liquids
- 4.1 A Flammable solids (explosive)
- 4.1 B Flammable solids and desensitized substances
- 4.2 Substances liable to spontaneous combustion
- 4.3 Substances that form flammable gases in contact with water
- 5.1 A Oxidizing substances (strong oxidizer)
- 5.1 B Oxidizing substances
- 5.1 C Oxidizing substances (ammonium nitrate)
- 5.2 Organic peroxides and self-reactive substances
- 6.1 A Combustible acute toxic substances
- 6.1 B Non-combustible acute toxic substances
- 6.1 C Combustible toxic substances or substances with chronic effect
- 6.1 D Non-combustible toxic substances or substances with chronic effect
- 6.2 Infectious substances
- 7 Radioactive substances
- 8 A Combustible corrosive substances
- 8 B Non-combustible corrosive substances
- 10–13 Other combustible and non-combustible substances
- 10 Other combustible liquids\*
- 11 Other combustible solids\*
- 12 Other non-combustible liquids\*
- 13 Other non-combustible solids\*

\*Optional storage class for substances of storage class 10–13

When the recommendations for mixed storage of chemicals of StoreCard are used, national regulations for separate and segregated storage must also be adhered to.

The mixed storage table indicates whether a product in a particular storage class may be stored together with one in another class, whether such mixed storage together is prohibited (separate storage required) or whether there are restrictions on mixed storage that have to be observed (segregated storage in the same storage area required).

#### Separate storage:

The term "separate storage" means locating products in different storage areas. A storage area is a section of a warehouse is separated from other rooms by either by fire-resistant walls and ceilings or safety cabinets or both.

Separate storage may be necessary to avoid the increased risk which may happen if contact occurs between products of different storage classes.

#### Segregated storage:

The term "segregated storage" means storage in the same storage area where the products are separated from one another by gaps or barriers (e.g. walls, non-combustible substances of storage class 10 – 13 or in safety cabinets made of non-combustible material). The mixed storage of products of differing storage classes is only permitted if certain conditions are met (e.g. identical extinguishing agent for all products, identical temperature conditions). Segregated storage within one area may also be necessary if certain products are in the same storage class, but have special properties. This is also the case for products in differing storage classes, with particular properties, for which mixed storage in accordance with the mixed storage table is normally permitted (Example: cyanides must not be stored together with substances, such as acids, with which they can form hydrogen cyanide.). Information on this is available in the hazard and precautionary statements (e.g. H271, H272, H304, EUH029, EUH031, EUH032, P220, P223 or P420). However, chapter 10 (stability and reactivity) of the MSDS is of no use.

### Important rules

1. A risk assessment is necessary. Are there no significant risks a mixed storage is permitted.
2. Combustible substances, with the exception of flammable liquids, may be stored in storage areas in which there are no more than 50 full compressed-gas cylinders – of which a maximum of 25 of them contain flammable, oxidizing or toxic gases – provided the storage area for compressed-gas cylinders is separated by an at least two-metre high wall made of non-combustible building materials. Alternatively, there must be at least five-metres distance between the gas cylinders and the combustible substances.
3. Up to 150 compressed-gas containers containing flammable, oxidising and inert gases may be stored together. In addition 15 compressed-gas containers with toxic and highly toxic gases may be stored together with them at the same time.
4. Mixed storage is permitted if the following restrictions and quantities are adhered to:

		Maximum quantity (tonnes)				
		3	4.1 B	5.1 B	6.1 A	6.1 B
1	restrictions	1	10 <sup>1)</sup>	1	1	1
2	only with a functioning automatic fire-alarm system		20			
3	only with a functioning automatic extinguisher system	20	100 <sup>1)</sup>	20	20	20

<sup>1)</sup> These quantities apply only to the mixed storage of store class 4.1 B with store class 6.1 A.

5. Materials that ignite easily or cause a fire to spread rapidly, such as packaging materials, must not be stored together with toxic substances or flammable liquids.
6. Products which do not react with one another in the event of an incident may be stored together. This can be achieved by segregated storage, e.g. physical separation, large gaps between containers, separate containment basins, or storage in safety cabinets.
7. Mixed storage with non-combustible substances is permitted. For mixed storage with combustible substances see point 4.

## Protective measures and rules of conduct

The potential harm that may arise in the storage of chemicals depends not only on the quantities involved, but also on the particular hazards they pose. Uncontrolled storage is not permitted. The following requirements apply to all hazardous chemicals.

1. Safety instructions, which relate either to individual chemicals or to classes of chemicals with the same hazardous properties, need to be compiled.
2. Chemicals must be stored strictly according to the warehousing plan.
3. Workers must wear suitable protective clothing (overalls, safety shoes and as needed, also safety goggles and protective gloves) within the warehouse.
4. There must be a strict ban on naked flames, unshielded lights and smoking.
5. Stored goods must be handled in a way that prevents damage to packaging and the escape of chemicals.
6. Escape routes, emergency exits and access routes for the emergency services must be kept free at all times.
7. Suitable fire extinguishers (ABC powder extinguishers), first-aid boxes and eyewash bottles must be close at hand.
8. Written permission must be obtained before any welding is undertaken. The same applies to the use of power tools (for drilling, grinding, etc).
9. There must be a strict ban on smoking, eating and drinking in areas where chemicals are stored.

# Dangerous goods transport

## Transport regulations for dangerous goods

This catalog contains information concerning the transportation of dangerous goods. This page provides a basic introduction to the transportation of dangerous goods and explains some of the terms and abbreviations used throughout the catalog.

### General

Dangerous goods may only be carried on public transportation networks as long as there are adequate measures in place to ensure that they can be moved safely. These measures cover in particular:

- packaging that is physically suitable, properly labelled, type-approved and permitted under the relevant transport regulations.
- consignment paperwork showing required data (such as, and especially, the addresses of the sender and recipient; proper labeling, designation and classification of the substances in question; number and description of the packaging units used).
- safe loading onto/into the carrying vehicle/container.

Dangerous goods are classified as follows irrespective of carrier:

#### Class Meaning

- |     |   |
|-----|---|
| 1   | Explosives  |
| 2   | Gases   |
| 3   | Flammable liquids   |
| 4.1 | Flammable solids  |
| 4.2 | Substances liable to spontaneous combustion                 |
| 4.3 | Substances which in contact with water emit flammable gases |
| 5.1 | Oxidizing substances  |
| 5.2 | Organic peroxides   |
| 6.1 | Toxic substances  |
| 6.2 | Infectious substances                                       |
| 7   | Radioactive material  |
| 8   | Corrosive substances  |
| 9   | Miscellaneous dangerous substances                          |

### UN number

The UN number is a four-digit number issued by the United Nations Subcommittee of Experts to individual dangerous goods and to groups of dangerous goods having the same or similar properties. In some cases, different numbers are issued depending on the particular carrier.

### Packing category

Dangerous substances may only be packed together with other substances (whether dangerous or not) in a single shipment provided such a consignment is not prohibited by the dangerous goods regulations covering the type of carrier, and as long as the substances being shipped cannot enter into dangerous reactions with one another. Merck Millipore has defined its own packing categories so as to cover substances having the same properties and posing the same type of risk within one and the same hazard grouping. It is permissible, therefore, to pack together dangerous goods from the same hazard class and packing category.

### Carriers

The different conditions under which goods are carried by land (road, rail and inland waterway), sea and air are the reason why there are numerous differences in the regulations binding each type of carrier.

### Transportation by land

Regulations covering transport by road and rail are largely the same.

### Road – ADR

The European agreement on cross-border transportation of dangerous goods by road (Accord européen relatif au transport international des marchandises Dangereuses par Route) regulates cross-border trucking of dangerous goods.

### Rail – RID

RID, the international regulations covering transportation of dangerous goods by rail (Règlement International concernant le transport des marchandises Dangereuses par chemin de fer) apply to rail shipments from one country to another within Europe. The RID and ADR regulations are virtually the same, though there are differences in the means by which substances may be transported (e.g. in tank cars).

### Sea – IMDG

The International Maritime Dangerous Goods Code was drawn up to regulate the sea shipment of dangerous goods.

### Air – IATA/ICAO

The ICAO (International Civil Aviation Organization) has compiled technical instructions for sending dangerous goods by airfreight (ICAO/TI). IATA-DGR regulations (International Air Transport Association – Dangerous Goods Regulations) contain all of the requirements embodied in ICAO/TI plus additional requirements and restrictions. IATA-DGR is therefore the basis used for sending dangerous goods by air. Separate requirements concerning packaging and maximum packaged quantity per primary packaging unit/consignment pack exist for transport by passenger aircraft (PAX) and freight aircraft (CAO).

### PAX

In this catalog under “PAX” (= passenger aircraft) you will find the relevant packing instruction defining the permitted packing and shipping quantities for dangerous goods sent by passenger aircraft. An F signifies a ban on transport by passenger aircraft (Forbidden).

### CAO

In this catalog under “CAO” (= cargo aircraft) you will find the relevant packing instruction defining the permitted packing and shipping quantities for dangerous goods sent by cargo aircraft. An F signifies a ban on transport by cargo aircraft (Forbidden).

## Notes for collection and treatment of chemicals in loose small quantities

When using chemicals, prime importance must be attached to the proper disposal of waste. This is important for the environment and is a considerable cost factor. Please take these factors into account when planning your use of chemicals.

### Small packs may be the solution

Merck supplies more than 5,000 products in small packs. The safety advantage of hazardous products in small packs is obvious: there is less or no residue, hence disposal is easier.

### Prevention of waste water pollution

It is principally prohibited to dispose of waste by releasing it into the sewage system. Please bear in mind that many chemicals cannot be readily degraded by waste water treatment plants and that they thus enter the environment in an unaltered state. The disposal of waste material via the drains should, therefore, be avoided at all costs.

### Recycling unused and used chemicals

Before you send any unavoidable remainders of chemicals, chemical mixtures, or other related products for disposal, please check whether the possibility exists to recycle them by appropriate pretreatment (distillation, separation of defined chemicals, transformation, etc.).

## Recycling Industrial and Waste Disposal Act and European Disposal Directive

In particular, we refer to the necessity of being able to prove that waste material has been disposed of properly. The person or company producing such chemical waste is responsible for its disposal even if a disposal company has been authorized to carry out the disposal. Within the EU, disposal is regulated by an EU Directive that has to be incorporated into national law of the Member States. The Directive defines waste and the objects to be protected. However, in carrying out disposal, all other national regulations must be adhered to.

## Collection of laboratory waste

Laboratory waste should be collected for disposal in separate containers according to the type of chemical involved. The containers can, for example, be labelled according to the schedule described below and labelled with the letters A-K. In doing so, it must be ensured that the chemicals collected in any one category cannot react with each other. At least a check should be made for acid and base content. Many disposal companies require a neutral solution to be provided.

- A** Halogen-free organic solvents and organic substances in solution.
- B** Halogen-containing organic solvents and organic substances in solution. Attention: Do not use aluminium containers!
- C** Solid residues of organic laboratory chemicals.
- D** Salts in solution; the contents of such containers should be adjusted to pH 6 – 8.
- E** Toxic inorganic residues and salts of heavy metals and solutions.
- F** Toxic flammable compounds.
- G** Mercury and inorganic mercury salt residues.
- H** Metallic-salt residues; each metal should be collected separately.
- I** Inorganic solids.
- K** Separate collection of glass, metal, and plastic waste materials.

The collecting vessels should be clearly labelled with the contents and provided with hazard symbols and safety phrases. Please note that double labelling may be necessary, e.g. if flammable liquids are collected in aqueous solutions of category D, if organic solutions react caustically, if bases and acids are contained or if poisons are collected in categories other than E and F. Of course, other categories may be designated if: This is meaningful. Adequate space is available. The total volume allowed to

be stored is not exceeded. Thus, it is recommended that those substances hazardous to health as well as irritating and poisonous substances be collected together; however, two containers – one for substances that are hazardous to health and the other for poisonous substances – may be used.

### Chemicals in closed containers:

Collect. Remove and treat only in exceptional cases. Apply the principle of minimum personal safety risk!

### Chemicals in loose quantities:

Treat if spontaneously flammable, oxidizing, or reactive with water or other substances. To prevent uncontrolled reactions, it is in principle recommended to pack waste chemicals individually (plastic bags or containers) before placing them in collecting vessels! Special caution should be taken with explosive substances, which should be disposed of separately only in phlegmatized form.

### Container for organic solvents:

In order to enable laboratory waste to be disposed of properly and to minimize the effect on laboratory routines, collection containers designated for waste materials must be:

- Able to cope with the chemicals involved
- Unbreakable
- Leakproof and gas-tight
- In possession of a UN certificate for transport if they are to be transported on public roads.

In addition, the following points should be taken into account:

- The containers should be located in a well-ventilated place
- The containers should be kept closed to prevent evaporation of harmful vapors
- Select containers of a size that will prevent the waste being kept too long at the place of storage. This also minimizes the risk of leakage.

Based on experience of the routines of many laboratories, the following containers can be recommended:

Container for liquid organic waste, for aqueous and contaminated waste, acids and bases:

Combi-container, 10 l with PE inliner, Ord. No. 9.43442.1013.

Container for solid chemical waste:

Such waste should whenever possible be collected in containers made of the same material – glass, metal, plastic – as the original product container.

## Tips for collecting and neutralizing laboratory waste

It should be taken into account that it may frequently be necessary to deactivate waste material before storing it. The purpose of this is to convert small quantities of reactive material into harmless secondary products hence facilitating storage and subsequent disposal. Prior to doing this, however, you should check whether you can return the material to the manufacturer.

Please also bear in mind that such treatment normally increases the amount of material to be disposed of. Thus, first check with your Safety Officer or disposal unit as to whether the material you have can be disposed of as it is or whether it must first be treated.

Utmost care is called for when handling laboratory chemicals and particularly when neutralizing reactive chemicals, since frequently violent chemical reactions occur. All such work must, therefore, be carried out by qualified personnel and under strict observance of the respective safety measures, in an efficient hood with the front screen closed.

When carrying out these activities, general safety rules must be adhered to at all times.

The method chosen to neutralize the chemical product in question must at all costs be tried out first on a small scale to see if there are any unforeseen problems. Always choose a suitable type and size of laboratory vessel!

The instructions for the neutralization of reactive chemicals described in the following are of general nature and should not be taken as operating procedures. Prior to undertaking the tasks described below, it is absolutely necessary for an experienced and qualified person (chemist, chemical engineer, technician) to compile a detailed operating procedure – listing all the appropriate safety measures – with reference to the relevant literature.

Refer also to any Safety Data Sheets supplied by the manufacturer. However, no guarantee can be given that in carrying out deactivation instructions all potentially dangerous substances can be completely deactivated.

To facilitate the disposal of small quantities, each entry in the catalog includes a key word "Disposal", followed by a code number that refers to the respective paragraph set out below. The container stipulated for the collection of the chemical in question is given a code letter from **A** to **K** as described above. Should a particular substance not be provided with a corresponding descriptive label, several treatments may have to be carried out consecutively.

## Code

**1** Strongly contaminated halogen-free organic solvents: container **A**.

**2** Organic halogenated solvents and solutions of organic halogen-containing substances: For strongly contaminated or mixed halogenated solvents container **B**. Caution: Do not use aluminium containers; in addition, in the case of watercontaining chlorinated waste materials do not use stainless steel containers (danger of leaks caused by corrosion).

**3** Relatively unreactive organic reagents should be collected in container **A**. If halogenated, they should be collected in container **B**. For solid residues use container **C**.

**4** Liquid organic acids or solutions should be diluted, if necessary, and carefully neutralized with sodium hydrogen carbonate (Cat. No. 106323) or with sodium hydroxide (Cat. No. 106462). Before filling into container **D**, check the pH with pH universal indicator strips (Cat. No. 109535).

**6** Sulfides and sulfites as well as other reducing substances, inorganic cyanides and isonitriles: Stir into sodium hypochlorite solution (Cat. No. 105614) and, if necessary, leave to react for several days. Caution: some substances may show a violent reaction! Draw off any toxic or flammable gases that may be formed. Excess oxidant should be neutralized with sodium thiosulfate (Cat. No. 106513). Container **D** or **E**.

**8** Hydrolysis-sensitive organoelement compounds and metal alkyls, which are as a rule dissolved in organic solvents, should be carefully stirred dropwise into 1-Butanol (Cat. No. 822262) in a hood with the front screen closed. Any flammable gases formed should be fed via a tube directly into the extractor duct. When gas development has ceased, continue stirring for one hour and add an excess of water. Container **A**.

**9** Carcinogenic compounds and flammable compounds labelled "Highly toxic" or "Toxic" (except solvents): container **F**. Alkyl sulfates are carcinogenic; take particular care to avoid inhalation and skin contact. To neutralize alkyl sulfates, add dropwise (from a dropping funnel) to concentrated ice-cool ammonia solution (Cat. No. 105426) with vigorous stirring. Before placing in container **D**, check the pH with pH universal indicator strips (Cat. No. 109535).

**10** Organic peroxides can be detected in aqueous solutions or organic solvents. Pure peroxides are diluted to min. 10% in a suitable solvent or with water and added in small portions, with temperature control, to iron(II) chloride (Cat. No. 103860) solution. Container **D**. Explosive substances (storage class 4.1A) should be packed separately and tightly sealed for disposal. Ensure sufficient phlegmatization by water or the stated phlegmatizing agent!

**25** Red phosphorus must not come into contact with oxidizing substances. Container **I**. Phosphorus compounds should be oxidized under an inert gas in an efficient hood with the front screen closed. From each gram

## Disposal of reagents and chemical waste

---

of phosphorus compound measure out a 100 ml aliquot of 5% sodium hypochlorite solution (Cat. No. 105614) containing 5 ml of 50% sodium hydroxide solution (Cat. No. 106462), and carefully add the substance solution to be neutralized a drop at a time, cooling with ice. Add calcium hydroxide (Cat. No. 102047) and filter off the precipitated phosphates. Precipitate: container I; aqueous solutions: container D.

**26** Alkali and alkaline-earth metals should be taken up in an inert solvent and neutralized by adding 2-propanol (Cat. No. 100995) dropwise with stirring. Should the reaction be more violent than expected, conversion should be carried out with tert-butanol or octanol. Caution: This reaction produces hydrogen, which can form explosive mixtures; take necessary precautions. When the reaction has ceased, add water dropwise; neutralize; container D. In the case of alkali or alkaline-earth borohydrides, add methanol (Cat. No. 106008) with stirring; in the case of alkali or alkalineearth amides and hydrides, organoaluminium and organotin hydrides, add 2-propanol (Cat. No. 100995) dropwise. The substances, which are usually in solid form, should be previously suspended in an ether! When the respective reaction has ceased, hydrolyze with water; then neutralize. Container D or E. Lithium aluminium hydride must also be destroyed by slurrying in an ether. Under an inert gas and with thorough stirring, add dropwise a 1:4 mixture of ethyl acetate (Cat. No. 822277) and the ether used to prepare the slurry. Always ensure thorough mixing (stirring)! Container A.

**27** Residues containing valuable recoverable metals should be forwarded for recycling; container H.

**28** Aqueous solutions: container D.

**30** The Extran® laboratory cleaning agents are biodegradable. If during cleaning operations environmentally harmful materials have been collected, the washwater should be collected in container D.

**32** Chromatographic residues: Aggressive, explosive (e.g. peroxides) or toxic substances in chromatographic layers or sorbents must be eliminated using suitable methods (washing out, elution) prior to disposal. The solvents used for elution can in many cases be reutilized. Larger quantities of sorbents (e.g. from columns) should be freed from solvents (filtration, drying) and packed into rip-resistant plastic sachets; container I. TLC carrier materials and columns should be disposed of together with the corresponding waste materials (aluminium, glass, plastic); container K.
